

Key Differences Between AS2 and EDI

AS2

Secure and reliable transmission of B2B data over the internet

Ensures that this standardized information can be sent securely and verified upon receipt

Specifically designed for secure internet transmission, often used for EDI data but not limited to it

EDI

Format and structure of the data being exchanged

Standardizes the information so it can be processed automatically by different systems

Can be used with different transmission methods, not just AS2 (e.g., FTP, VAN)
