EDI
## Process Flow

EDI or Electronic Data Interchange is a communication technology of exchanging business documents like invoices, purchase orders, sales orders and advanced shipping notices, in a standard electronic format, as an alternative for traditional paper-based communication.

An EDI transmission software facilitates the communication bridge between trading partners. Once the partners agree with a particular EDI standard format and a transmission protocol, they have to find software which provides communication using that protocol. Then companies will add each other as their trading partners in each of their transmission software and do the necessary configurations.
